Main and emergency switchboards
Regardless of the size of vessels, power distribution and automation control are most important for their reliable functioning. We offer complete energy systems, switching, distributing, protecting, measuring and controlling devices, which are able to meet the highest requirements for reliability, durability and safety.

Power distribution systems can be divided into two main groups:

- MSB – Main Switchboard.
- ESB – Emergency Switchboard.

The control switchboards are used to control various types of shipborne systems. We design and manufacture control panels according to the own or investor documentation with the use of world’s leading manufacturers equipment.

We specialize in design and construction of new complete systems as well as repairs and adaptations of existing systems.
